👥 Stakeholders	
▼ Status	
▼ Type	

Wire-framing

- wire-framing is the process of mapping out the design of a website and is used to;
 - plan the implementation of code, helping to ensure clarity and efficiency
 - contractually agree functionality and aesthetics with a client
- Many programs exist to help, but Figma seems the best and is free
- **low-fidelity** wire-frames can be handwritten or drawn on a white background
 - made of simple boxes and buttons
 - they focus on the layout and basic functions rather than styling
- **high fidelity** wire-frames look exactly how the website should will in the end
 - they employ custom fonts, contain full images and proper colours etc.
 - usually produced professionally by a Graphic / UI / UX designer

Pair Programming

- 2 developers working on 1 computer together
- **driver** - the person writing the code
- **navigator** - the person making suggestions
- periodically they will switch roles
- works best when navigator is the more experienced or confident developer
- driver needs to ensure they understand everything they type
- **benefits**
 - 2 sets of eyes and two brains on the code - more likely to spot mistakes and include novel or more efficient ideas
 - working while being observed helps to maintain code quality standards
 - more people in the team understand the code - prevent *knowledge silos*
 - helps juniors to learn

- **drawbacks**
 - perceived as waste of resources by management (non-technical staff)
 - if the work is wrong on goes unused then double effort has been wasted
- **Ask you interviewer** if they implement it - see if you want to join the company

Rubber Duck Debugging

- A way to discover a solution to a problem by articulating it to an inanimate object
 - get yourself a rubber duck
 - name it, shame it, make sure it knows who's boss
 - explain your problem in ways the duck can understand, ensuring no detail is missed
 - during this process you will likely solve the problem you had in the first place
 - now throw the duck at the wall to ensure it doesn't get a bit up itself

Standup

- A short meeting at the start of each day to allow reflection on the previous working day
 - What did you enjoy?
 - What did you not enjoy?
 - What would you like to go over again?
 - Any other business?

Code Review

- whenever a new version of code is written, someone else must read through it in detail to ensure no mistakes have been made
- the code reviewer is attempting to ensure best practices and catch bugs
- for critical sections of code, multiple reviewers may be required
- **benefits**
 - massively improved quality of code
 - more bugs can be identified and fixed before going live
 - prevents the formation of code silos
 - good learning opportunity for less experienced devs
- **reviewing criteria**
 - correct and consistent indentations, spaces, hex codes, etc
 - semantic class names used appropriately
 - consistent naming scheme
 - camelCase
 - kebab-case
 - snake_case
 - approach to the problem - is it a hack or an elegant solution?
 - ensure logic and functionality is stable - failing automated unit tests indicates the project is not ready for code review
 - cross-browser testing (for any browsers officially supported by the project)
- **core skills**
 - kindness and diplomacy are important when pointing out others mistakes
 - thoroughness is required, if a bug makes it to a live website it is partially on the reviewer
 - willingness to learn from others example of code

Building an Online Presence

- the tech sector is very internet based and humans are social creatures. Build an online presence to exploit this to the advantage of your career ^_^
 - LinkedIn - online CV - put a picture
 - Twitter - is good for jobs etc but too evil to consider
 - Github - good to have a public account full of projects to showcase your code
 - Medium / dev.to - nerd blogging to demonstrate your ability to understand and explain
 - customer website - take over the world
